## EXECUTIVE SUMMARY

Kimley-Horn was retained to conduct a Traffic Impact Analysis (TIA) of future traffic conditions associated with a mixed-use development located on Henderson Avenue between Glencoe Street and McMillan Avenue in Dallas, TX. The proposed mixed-use development would comprise approximately 190,000 SF and would consist of retail, restaurant and office space (approximately 170,000 SF on the north side of Henderson and 20,000 SF on the south side). Although this study designates 2016 as the buildout year (which is not the case anymore) the analysis is still valid. This study is intended to identify traffic generation characteristics, identify potential traffic-related impacts on the local street system and to develop mitigation measures required for identified impacts.

The following existing intersections were selected to be part of this study through discussions with the City of Dallas:

- Henderson Avenue and Belmont Avenue
- Henderson Avenue and Capitol Avenue
- Henderson Avenue and Glencoe Street
- Henderson Avenue and Fuqua Street
- Henderson Avenue and McMillan Avenue
- Henderson Avenue and Monarch Street

The analysis also included the following proposed driveways (see **Exhibit 1**):

- Drive A, a full access driveway located just east of Glencoe Street
- Drive B, an inbound only driveway located east of Drive A. Drive B accesses retail on the south side of Henderson Ave.
- Drive C, an outbound only driveway located east of Drive B.
- Drive D, a full access driveway located at the intersection of Henderson Avenue and Fuqua Street
- Drive E, a full access driveway located east of Fuqua Street

Traffic operations were analyzed at the study intersections for existing volumes, year 2016 and 2035 background traffic volumes and year 2016 and 2035 background plus site-generated traffic volumes. The future years correspond to the projected site buildout year and nineteen years later. With the proposed zoning change, the development is expected to generate approximately 6,561 daily one-way trips, with 389 AM peak hour one-way trips and 629 PM peak hour one-way trips. The distribution of the site-generated traffic volumes onto the street system was based on the surrounding roadway network, existing traffic patterns and the project's proposed access locations. Based on current zoning, the fully developed site would allow for a total of 106 dwelling units (4 bedrooms to a unit, 1 person per bedroom, for a total of 424 persons) for residential multifamily land use and 36,975 SF (this number does not include any patio dining area, which in this case would be approximately 10,000 SF) of bar and restaurant land uses. A fully developed site based on existing zoning would generate a total of 6,104 daily one-way trips with 519 AM peak hour one-way trips and 534 PM peak hour one-way trips.

Analysis results indicates that the signalized intersections of Henderson Avenue/Belmont Avenue and Henderson Avenue/McMillan Avenue will continue to operate at overall LOS C or better throughout all the scenarios evaluated for the years 2016 and 2035.

The study area unsignalized intersection approaches are expected to operate within acceptable conditions for 2016, except for the southbound approach at Henderson Avenue and Drive E, which is expected to operate at LOS E conditions during the PM peak. All proposed driveways are expected to operate at or above LOS D conditions for both AM and PM peak periods for opening year 2016.

Analysis results for year 2035 during the AM peak hour shows all unsignalized intersections and driveways operating at LOS D or above, except for the northbound approach of Henderson Avenue and Capitol Avenue, which is expected to operate at LOS F. Our recommendation to mitigate long delays on Capitol Avenue is to restripe it with a northbound left-turn storage lane. Although delay times are not ideal, the analysis shows a 95<sup>th</sup> percentile queue length of fewer than 4 vehicles for northbound Capitol Avenue.

Year 2035 PM peak hour results indicate that existing study area unsignalized intersections will continue to see increased delays and limited gaps as volumes increase on Henderson Avenue. Although this proposed development contributes to some delay throughout the study area in year 2035, background growth not associated with the development is also a contributing factor to study area unsignalized intersections operating over capacity. Although delay times have increased, the analysis shows a 95<sup>th</sup> percentile queue length of only 1-3 vehicles for all unsignalized intersection approaches, except for Capitol Avenue and Drive E. The 95<sup>th</sup> percentile queue lengths for Capitol Avenue and Drive E approaches are fewer than 5 cars. Even though three of the unsignalized approaches are operating at LOS F, delays seen in the models are typical of urban environments. If long wait times persist at Henderson Avenue and Capitol Avenue, drivers will divert to the signal at Belmont Avenue, which has ample capacity for year 2035. Furthermore, the proposed development includes a Traffic Management Plan (TMP), which will be updated biannually to reflect and address congestion issues on site driveways and adjacent streets.

The following roadway improvements are recommended to improve access throughout the study area:

#### General

1. Henderson Avenue will be improved to provide for a Two-Way Left Turn Lane (TWLTL) starting from just west of Glencoe Street and ending at McMillan Avenue. The TWLTL will provide for easier access to the driveways in and out of the site, while minimizing delays resulting from drivers turning left from Henderson Avenue. By contrasting the pavement color of the TWLTL and decreasing the width of the eastbound and westbound travel lanes, the resulting three lane configuration will encourage slower driving.

#### Drive A and Henderson Avenue

2. Although the available storage for this turn lane is minimal due to proximity of Glencoe Street, the 95<sup>th</sup> percentile queue is very minimal (1-2 cars).
3. Provide for a one-lane exiting approach (shared left/right lane).

#### Drive B and Henderson Avenue:

4. No intersection improvements are recommended at this driveway.
5. Drive will operate as inbound only.

Drive C and Henderson Avenue

6. No Intersections improvements are recommended at this driveway.
7. Drive will operate as outbound only. Provide for a one-lane exiting approach (shared left/right lane).

Drive D and Henderson Avenue

8. Provide for a two-lane exit consisting of a right-turn only lane and a shared through/left-turn lane.

Drive E and Henderson Avenue

9. Provide for a one-lane exiting approach (shared left/right lane)

Capitol Avenue and Henderson Avenue

10. Re-stripe northbound Capitol Avenue to include a left-turn storage bay.

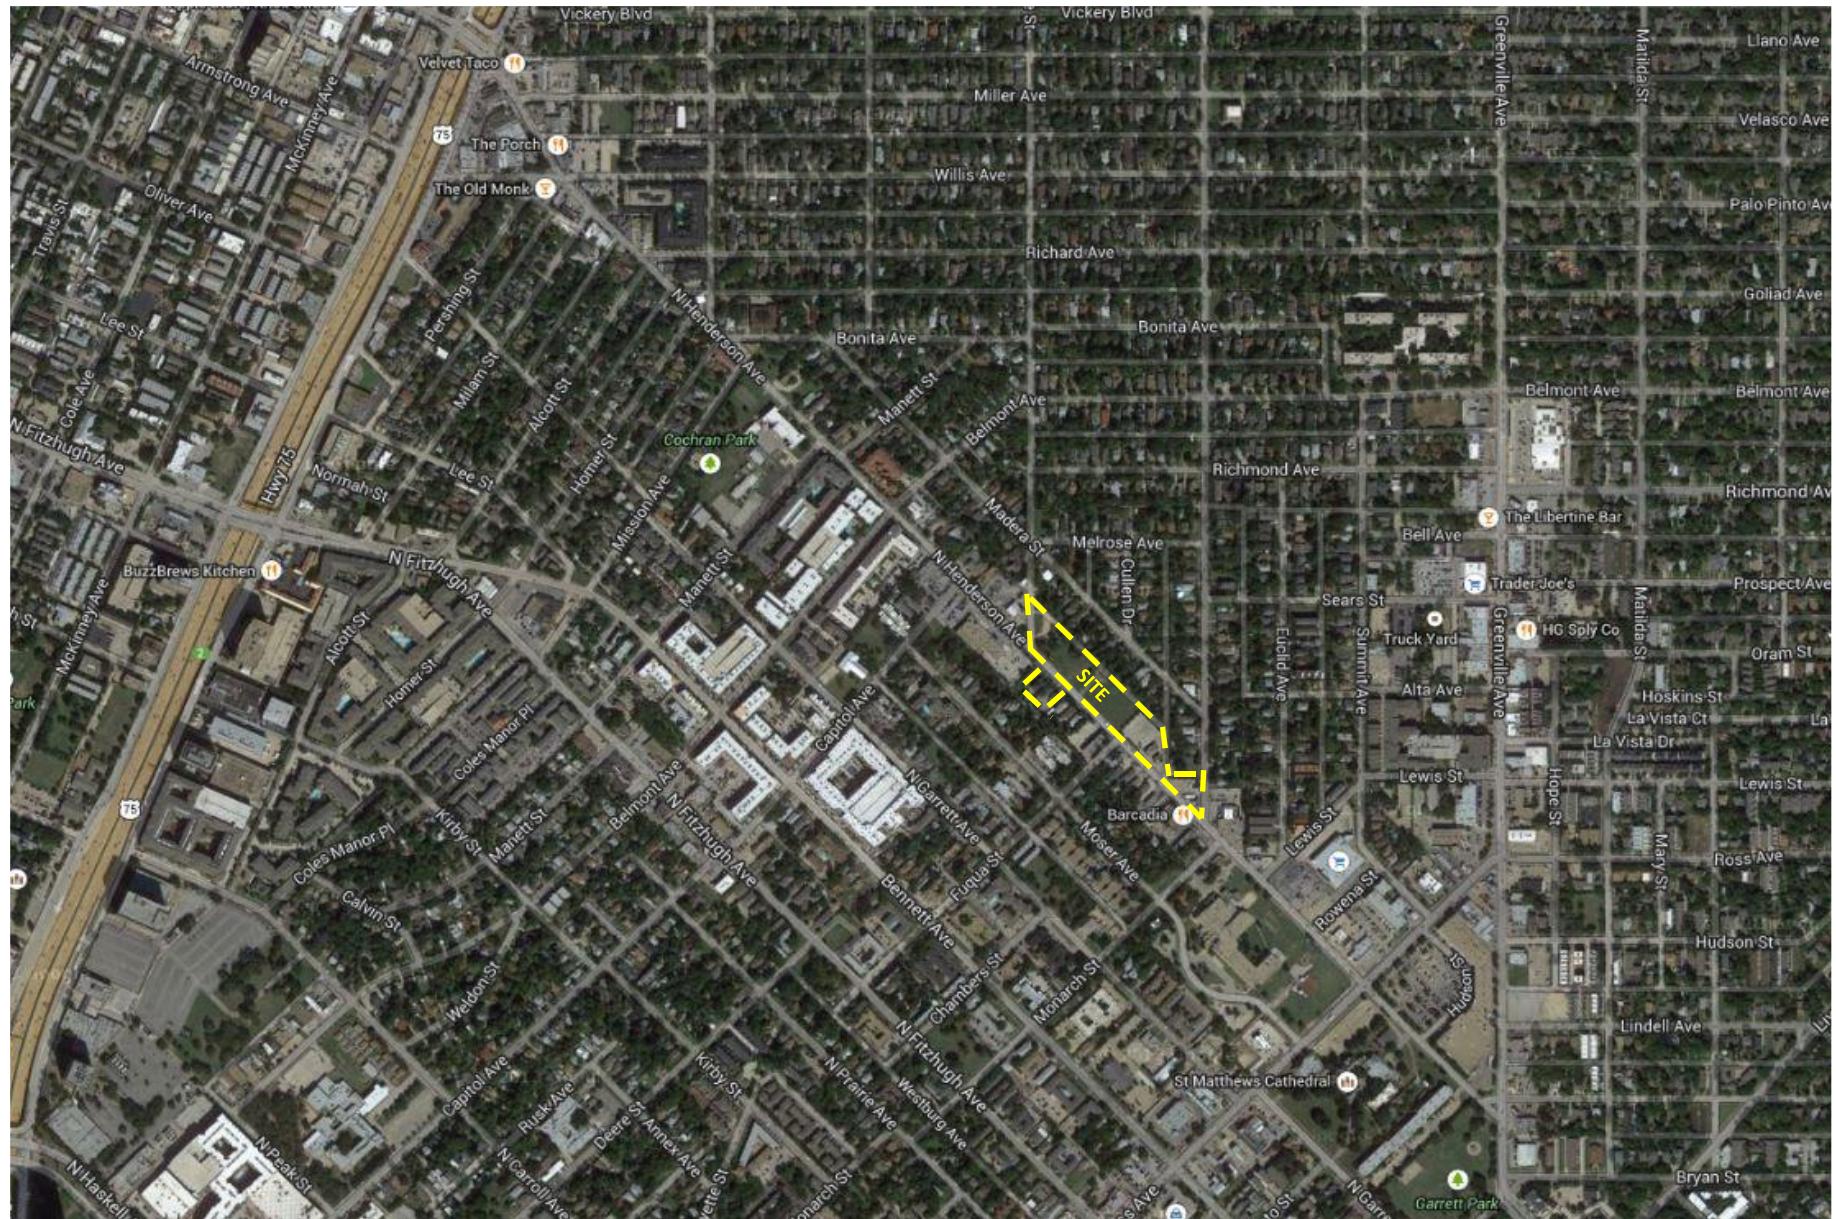

## I. INTRODUCTION

### A. Purpose

Kimley-Horn was retained to conduct a Traffic Impact Analysis (TIA) of future traffic conditions associated with a mixed-use development to be located on Henderson Avenue between Glencoe Street and McMillan Avenue in Dallas, Texas. A site vicinity map is provided as **Exhibit 1**. **Exhibit 2** shows the proposed development plan. This study is intended to identify traffic generation characteristics, identify potential traffic related impacts on the local street system and to develop mitigation measures required for identified impacts.

### B. Methodology

The traffic evaluation was comprised of five scenarios for which weekday AM and PM peak hour intersection level of service analyses were performed. Based upon the project's anticipated completion date, 2016 was assumed as the build-out year of the site, and 2035 was designated as a horizon year buildout. The first scenario analyzed existing traffic conditions (2014); the second scenario analyzed background traffic conditions in the site buildout year (2016); the third scenario analyzed total traffic (background plus site-generated) conditions in the site buildout year (2016), the fourth scenario analyzed background traffic conditions in 2035, and the fifth scenario analyzed total traffic conditions in 2035. For both unsignalized and signalized intersections, the capacity analyses were conducted using the *Synchro™* software package and its associated *Highway Capacity Manual* reports.

## II. EXISTING AND FUTURE AREA CONDITIONS

### A. Roadway Characteristics

The following existing intersections were selected to be part of this study through discussions with the City of Dallas:

- Henderson Avenue and Belmont Avenue
- Henderson Avenue and Capitol Avenue
- Henderson Avenue and Glencoe Street
- Henderson Avenue and Fuqua Street
- Henderson Avenue and McMillan Avenue
- Henderson Avenue and Monarch Street

The analysis also included the following proposed driveways:

- Drive A, a full access driveway located just east of Glencoe Street
- Drive B, an inbound only driveway located east of Drive A. Drive B accesses retail on the south side of Henderson Ave.
- Drive C, an outbound only driveway located east of Drive B.
- Drive D, a full access driveway located at the intersection of Henderson Avenue and Fuqua Street
- Drive E, a full access driveway located east of Fuqua Street

The major study area roadways are described below.

**Henderson Avenue** is a 2-lane undivided minor arterial that connects US 75 to Ross Avenue and Greenville Avenue. West of US 75, Henderson Avenue becomes Knox Street. Henderson Avenue forms the southern boundary, of the site and the posted speed limit is 30 mph.

**Belmont Avenue** is a 2-lane undivided local street that forms a traffic signal with Henderson Avenue west of the proposed site. Belmont Avenue connects to Fitzhugh Avenue to the south and to residential land uses north of the proposed site. The posted speed limit on Belmont Avenue is 30 mph.

**McMillan Avenue** is a 2-lane undivided local street that forms a traffic signal with Henderson Avenue on the east side of the property. McMillan Avenue connects to residential land uses north of the site and Mockingbird Lane. The posted speed limit on McMillan Avenue is 30 mph.

The rest of the roadways that are part of this study are local residential streets with low traffic volumes.

**Exhibit 3** illustrates the intersection geometry used for the traffic analyses for existing and future conditions.

### B. Existing Study Area

The project site is located on Henderson Avenue, between Glencoe Street and McMillian Avenue. North of Henderson Avenue, the property is mostly undeveloped. On the south

side of Henderson Avenue, the parcel is currently multifamily. The adjacent land use within the study area is primarily residential with some bars and restaurants located on both sides on the proposed site.

A fully developed site based on existing zoning would allow for a total of 106 dwelling units (4 bedrooms per unit, 1 person per bedroom for a total of 424 persons) for residential multifamily land use and 36,975 SF (this number does not include any patio dining area, which in this case would be approximately 10,000 SF) of bar and restaurant land uses. This will generate a total of 6,104 daily one-way trips with 519 AM peak hour one-way trips and 534 PM peak hour one-way trips.

## C. Proposed Site Improvements

The project is designed to provide a Complete Streets cross-section to encourage walkability along the Henderson Avenue corridor. The project proposes to accommodate all of the code required parking substantially below grade, with access provided at three driveways serving the northern tract and two driveways serving the southern tract on Henderson Avenue. In addition to parking for vehicles, parking for at least 30 bicycles will be provided on site to encourage biking to the development. The proposed site will comprise a total of approximately 190,000 SF, of which a maximum of 12,000 SF is designated for restaurant use, 90,000 SF for retail use and the remaining 88,000 SF for office use. In order to provide for easier access to and from the site and ease the traffic flow, the proposed development will also incorporate a two-way left turn lane (TWLTL) starting from just west of Glencoe Street and ending at McMillan Avenue.

**Drive A** will have unsignalized full access on Henderson Avenue. Drive A will consist of a single lane for shared right/left turning movements. Drivers traveling eastbound will be able to access the driveway via the proposed TWLTL to provide for improved access to the site.

**Drive B** will be an unsignalized, inbound only driveway accessing the proposed retail development on the south side of Henderson Avenue. Drivers traveling westbound will be able to access the driveway via the proposed TWLTL to provide for improved access to the site.

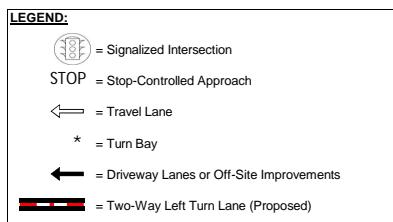

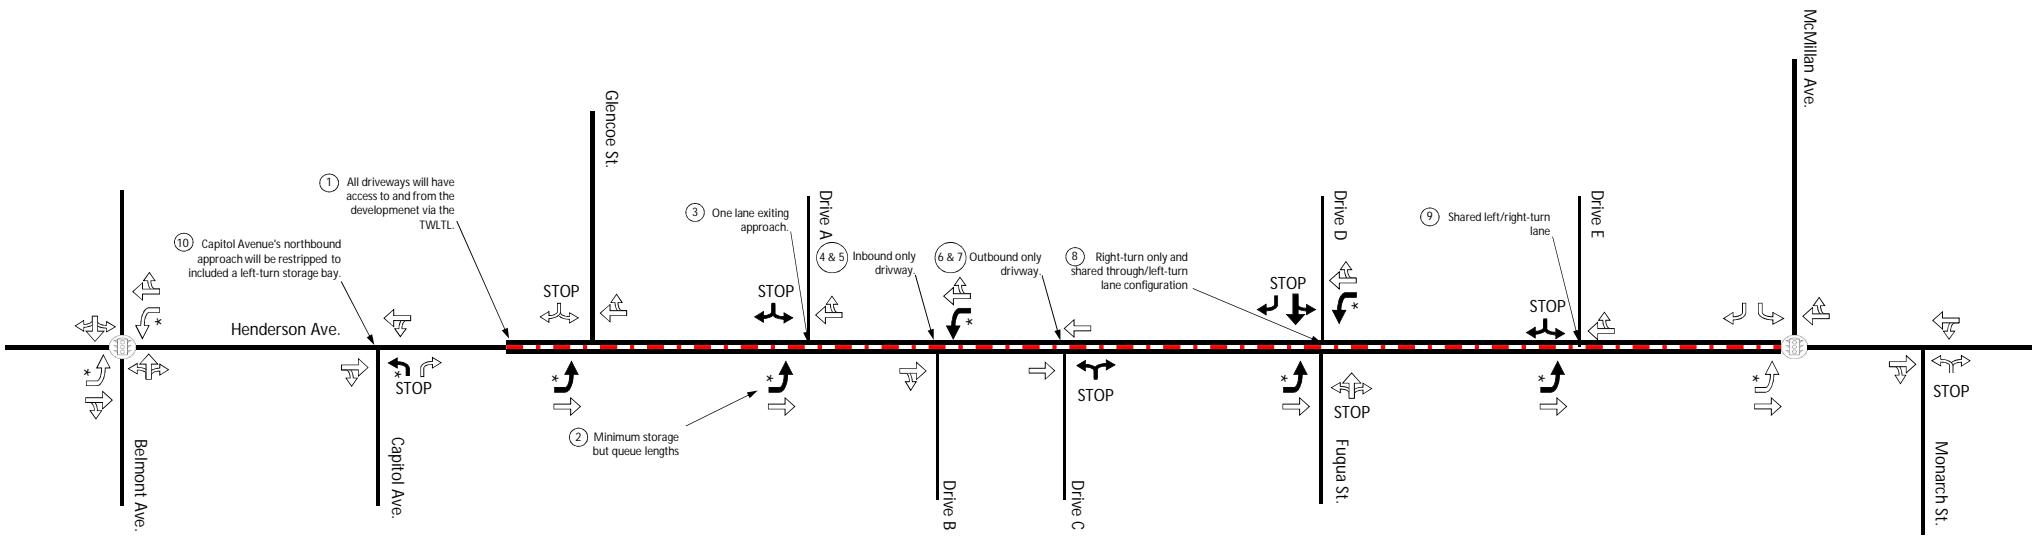

**Drive C** will be an unsignalized, outbound only driveway for the proposed retail property on the south side of Henderson Avenue.

**Drive D** will have unsignalized full access on Henderson Avenue. Drive D will be constructed directly across from Fuqua Street and will allow for additional access to the site. Drive D will consist of a two-lane exit striped for shared through/left-turn lane and a right-turn only lane. The proposed TWLTL will provide easier access to the site for eastbound and westbound drivers.

**Drive E** will have unsignalized full access on Henderson Avenue. Drive E will consist of a single lane for shared right/left turning movements. Drivers traveling eastbound will be able to access the driveway via the proposed TWLTL to provide for improved access to the site.

## D. Existing Traffic Volumes

Weekday AM and PM peak hour turning movement counts were collected on December 2, 2014 at the major study intersections. 24-hour machine counts were also collected adjacent to the site on Henderson Avenue (11,495 vehicles per day), Glencoe Street (750 vpd), Madera Street (271 vpd), McMillan Avenue (2,211), Belmont Avenue (4,710), Capitol Avenue (2,728 vpd), Fuqua Street (896 vpd) and Monarch Street (1,420 vpd). **Exhibit 4** shows the existing weekday AM and PM peak hour traffic volumes. The raw count sheets are provided in the **Appendix**.

### III. PROJECT TRAFFIC CHARACTERISTICS

#### A. Site-Generated Traffic

Site-generated traffic estimates are determined through a process known as trip generation. Rates and equations are applied to the proposed land use to estimate traffic generated by the development during a specific time interval. The acknowledged source for trip generation rates is the 9th edition of *Trip Generation Manual* published by the Institute of Transportation Engineers (ITE). ITE has established trip rates in nationwide studies of similar land uses. The trips indicated are actually one-way trips or *trip ends*, where one vehicle entering and exiting the site is counted as one inbound trip and one outbound trip.

Pass-by trips are existing vehicles on the adjacent roadways that choose to visit the new site and then return to their original path. Pass-by trips do not reduce the driveway volumes projected for the site, but are deducted from the net new traffic added to the area roadways, since they are already present. To be conservative, no pass-by trips were included in this analysis.

Reductions to the base trip generation estimates are sometimes applied due to internal capture or transit usage. Internal capture is the tendency for customers or residents to visit several parts of a multi-use development in one trip, but be counted twice in the trip generation since the formulae assumes the individual trip generators are isolated. Internal capture reduces the number of trips leaving the site and results in a projection of internal trips and external trips. To be conservative, internal capture was not included in this analysis.

**Table 1** shows the resulting Daily, and weekday AM and PM peak hour trip generation for the proposed development, showing net new trips.

**Table 1 – Trip Generation**

Land Uses	Amount	Units	ITE Code	Daily	AM Peak Hour One-Way Trips			PM Peak Hour One-Way Trips		
				One-Way	Trips	IN	OUT	TOTAL	IN	OUT
Office	88,000	SF	710	1,192	152	21	173	30	147	177
Retail - Shopping Center	90,000	SF	820	3,843	53	33	86	160	174	334
High-Turnover (Sit-Down) Restaurant	12,000	SF	932	1,526	72	58	130	71	47	118
<b>Total Net New External Trips:</b>				<b>6,561</b>	<b>277</b>	<b>112</b>	<b>389</b>	<b>261</b>	<b>368</b>	<b>629</b>

Trip Generation rates based on ITE's *Trip Generation Manual, 9th Edition*.

## B. Trip Distribution and Assignment

The distribution of the site-generated traffic volumes into and out of site driveways and onto the street system was based on the area street system characteristics, existing traffic patterns, relative residential density and the locations of the proposed driveway access to/from the site. The locations of other existing retail and restaurant sites in all four directions were also considered. **Table 2** displays the general directional distribution percentages assumed for the site.

**Table 2 – General Directional Distribution**

Direction (To/From)	Percent of Site Traffic
West (via Henderson Avenue)	55%
East (via Henderson Avenue)	32%
North (via McMillan Avenue)	2%
North (via Glencoe Street)	2%
South (via Belmont Avenue)	5%
South (via Capitol Avenue)	2%
South (via Fuqua Street)	2%

The corresponding inbound and outbound traffic assignment, where the directional distribution in **Table 2** is applied using the most probable paths to and from the site, can be found in **Exhibit 5**.

**Exhibit 6** shows the resulting site-generated weekday AM and weekday PM peak hour turning movements after multiplying the new external trip generation for each use by the traffic assignment percentages.

## C. Development of 2016 Background Traffic

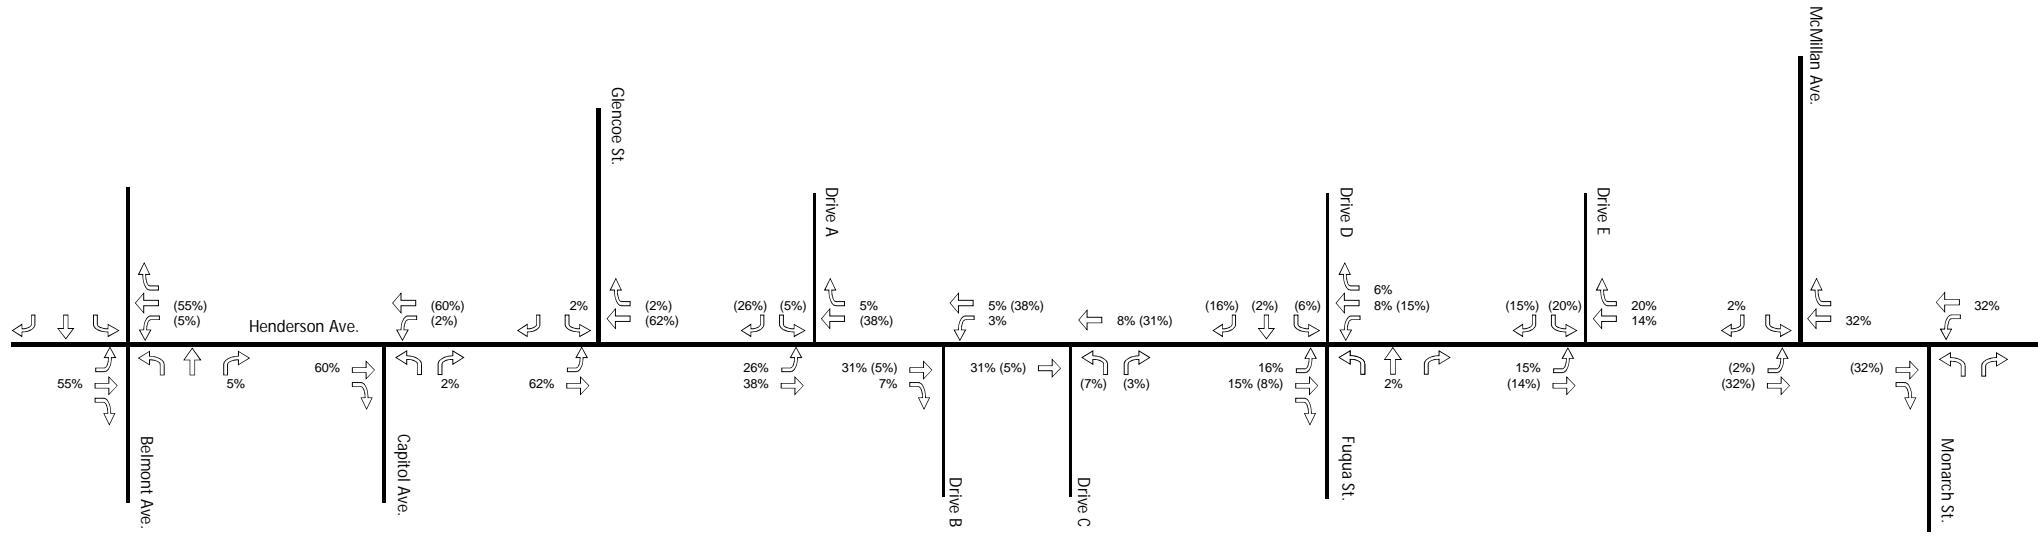

To obtain 2016 background traffic, the existing traffic counts and historic counts near the site were compared to find expected growth trends within the study area. Traffic counts taken on Henderson Avenue near the study area were 12,733 vpd from 2002, 12,383 vpd from 2009 and 11,495 vpd from 2014. These counts indicate a downward trend for traffic volumes along the corridor. To be conservative, a 2% growth rate per year was still applied throughout the study area to account for future development not associated with this site. To develop 2016 background traffic, the existing 2014 traffic counts were grown by 2% annually for two years. The resulting 2016 background weekday AM and PM peak hour traffic volumes are shown in **Exhibit 7**.

## D. Development of 2016 Total Traffic

Site traffic volumes were added to the background volumes to represent the estimated total (background plus site-generated) traffic conditions for the 2016 study year after completion of the proposed development. **Exhibit 8** shows the resulting 2016 weekday AM and PM peak hour total traffic volumes.

## E. Development of 2035 Background and Total Traffic

The background and total traffic volumes in the 2035 study year were developed using the North Central Texas Council of Governments (NCTCOG) 2035 model. Results from the regional model (as shown in the Appendix) indicate approximately 14,000 vpd will be traveling on Henderson Avenue in year 2035. This is approximately 1% per year growth beyond the existing 11,495 vpd on Henderson Avenue. Existing traffic volumes were grown at 1% per year to develop year 2035 background traffic. To determine year 2035 total traffic conditions, the site-generated traffic was added to the background traffic. **Exhibit 9** shows the resulting 2035 weekday AM and PM peak hour background traffic volumes, and **Exhibit 10** shows the resulting 2035 weekday AM and PM peak hour total traffic volumes after the addition of the site-generated traffic.

## IV. TRAFFIC OPERATIONS ANALYSIS

Kimley-Horn conducted a traffic operations analysis to determine potential capacity deficiencies in the 2014, 2016 and 2035 study years at the study intersections. The acknowledged source for determining overall capacity is the current edition of the *Highway Capacity Manual*.

### A. Analysis Methodology

Capacity analysis results are listed in terms of Level of Service (LOS). LOS is a qualitative term describing operating conditions a driver will experience while traveling on a particular street or highway during a specific time interval. It ranges from A (very little delay) to F (long delays and congestion). **Table 3** shows the definition of level of service for signalized and unsignalized intersections. LOS D is generally considered the threshold for acceptable operations for signalized intersections in an urban area.

**Table 3 – Level of Service Definitions**

Level of Service	Signalized Intersection Average Total Delay (sec/veh)	Unsignalized Intersection Average Total Delay (sec/veh)
A	≤10	≤10
B	>10 and ≤20	>10 and ≤15
C	>20 and ≤35	>15 and ≤25
D	>35 and ≤55	>25 and ≤35
E	>55 and ≤80	>35 and ≤50
F	>80	>50

Definitions provided from the Highway Capacity Manual, Special Report 209, Transportation Research Board, 2010.

Study area intersections were analyzed based on average total delay analysis for signalized and unsignalized intersections. For the unsignalized analysis, the level of service (LOS) for a two-way stop controlled intersection is defined for each movement. Unlike signalized intersections which define LOS for each approach and for the intersection as a whole, LOS for two-way stop-controlled intersections is not defined as a whole.

Calculations for the level of service at the key intersections identified for study are provided in the **Appendix**. The analyses assumed the lane geometry and intersection control shown in **Exhibit 3**.

### B. Analysis Results

**Tables 4** and **5** show the intersection operational results for the weekday AM and PM peak hours, respectively.

### C. 2014 Existing Traffic Operations

The analysis of the 2014 existing traffic operations shows both the signalized intersections of Henderson Avenue and Belmont Avenue, and Henderson Avenue and McMillan Avenue operating at overall LOS B during both peak periods.

All unsignalized intersection approaches are currently operating within acceptable conditions at or above LOS C conditions.

### D. 2016 Background Traffic Operations

The addition of two years of background growth adds a small amount of average delay to the signalized and unsignalized intersections. All intersections remained at or above LOS C conditions.

### E. 2016 Background Plus Site-Generated Traffic Operations

The addition of the site-generated traffic to the 2016 background traffic resulted in a small amount of additional delay at the existing signalized intersections. However, overall LOS remained the same for both signalized intersections for AM and PM peak hour.

For the AM peak hour, the northbound approach for the unsignalized intersections of Henderson Avenue and Capitol Avenue changed from LOS C to LOS D. All other unsignalized intersection approaches remained at LOS C or better for the AM peak hour.

For the PM peak hour, the southbound approach for the unsignalized intersection of Henderson Avenue and Drive E operates at LOS E. All other proposed site driveway approaches are expected to operate at LOS D or better for the PM peak hour.

## F. 2035 Background Traffic Operations

The addition of the background traffic adds a marginal amount of delay throughout the system. However, the signalized intersections remained at the same overall LOS when compared to existing conditions.

For the AM peak hour, the northbound approach for the unsignalized intersection of Henderson Avenue and Capitol Avenue changed from LOS C to LOS D. The remaining unsignalized approaches operated at LOS C or better.

For the PM peak hour, the northbound approach for the unsignalized intersection of Henderson Avenue and Capitol Avenue changed from LOS C to LOS E and is just shy of changing to LOS F. The northbound approach for the unsignalized intersection of Henderson Avenue and Fuqua Street changed from LOS C to LOS D. The remaining intersections operated at LOS D or better.

## G. 2035 Background Plus Site-Generated Traffic Operations

The addition of site generated traffic to the background traffic adds a marginal amount of delay throughout the system. For the PM peak hour, the signalized intersection of Henderson Avenue and Belmont Avenue changed from LOS B to C. The rest of the signalized intersections remained at the same overall LOS when compared to the previous scenario.

For the AM peak hour, the northbound approach for the unsignalized intersection of Henderson Avenue and Capitol Avenue changed from LOS D to LOS F. The northbound approach for the unsignalized intersection of Henderson Avenue and Fuqua Street changed from LOS C to LOS D. The remaining unsignalized approaches operated at LOS C or better.

For the PM peak hour, the northbound approach for the unsignalized intersection of Henderson Avenue and Capitol Avenue changed from LOS E to LOS F. The southbound approach of Henderson Avenue and Glencoe Street changed from LOS C to E. The northbound approach of Henderson Avenue and Fuqua Street changed from LOS D to F. The LOS for the northbound approach of Henderson Avenue and Monarch Street changed from LOS D to E. The southbound approach of Henderson Avenue and Drive E operates at LOS F. Both Drive A and Drive C approaches operate at LOS D.

Although a few of the approaches are experiencing LOS F, the delay for those approaches is manageable. The maximum delay experienced is at the northbound approach of Capitol Avenue which is 66.3 seconds. This kind of delay is typical of unsignalized intersections in urban environments. Furthermore, the northbound approach of Capitol Avenue at Henderson Avenue is 0.1 seconds away from being LOS F in the year 2035 without any addition of site traffic and the added site traffic is only 6 cars in the PM peak hour and 5 cars in the AM peak hour. The 95<sup>th</sup> percentile queue length for the northbound approach of Capitol Avenue and the southbound approach of Drive E is fewer than 5 cars. The 95<sup>th</sup> percentile queue at the northbound approach of Fuqua Street it is fewer than 3 cars. This means that there is not a persistent queue that

stays at those approaches for a prolonged period and the operations at those approaches remain acceptable.

## H. Link Analysis

The link capacity analysis examines the operating conditions of roadway links rather than intersections, and uses the daily traffic rather than the peak hours. The operating condition is defined by the ratio of link volume to link capacity, or V/C. The V/C of the different roadway links that would be impacted by the proposed development's traffic was calculated for the 2016 background and total traffic scenarios. The maximum daily capacity is calculated to be ten times the maximum hourly capacity, so the threshold for possible daily capacity is significantly lower than if the roadway was at maximum flow for an entire day. These theoretical capacity volumes were obtained from the North Central Texas Council of Governments (NCTCOG) tables of service volumes by lane, which are duplicated in the **Appendix**. For finding the capacity of each roadway, functional class is set to minor arterial for Henderson Avenue and collector for Belmont Avenue. Area type for both roadways was set to Urban Residential. The daily background volume on each link is found by applying the growth factor to known daily link volumes, then adding the percentage of the daily site traffic that uses at each link. **Table 6** summarizes daily volumes and volume-to-capacity ratios of the links considered for the 2016 and 2035 scenarios.

**Table 6 – Link Capacity Analysis**

Roadway From	To	Volumes		Capacity			V/C Ratios	
		Year	Daily Volumes	Number Of Lanes	Median Type	LOS 'E' Capacity	v/c Ratio	LOS
<b>Henders on Avenue - 2014 Existing</b>

<b>Belmont Avenue - 2035 Projections - With Site</b>								
South of Henderson		Background Proposed Site 5.0%	4,700 328	2	None	9,500 <sup>3</sup>	0.53	C
		Total:	5,028					

Notes:

1. Count data from KHA 2014 counts
2. 2016 volumes grown at 2.0% per year, 2035 volumes grown at 1.0% per year
3. Link Capacity from North Central Texas Council of Governments,  
using Urban Residential District

V/C	LOS	V/C	LOS
< 0.45	A/B	< 0.80	D
< 0.65	C	< 1.00	E
> 1.00			F

As seen in **Table 6**, Henderson Avenue is approaching its capacity in year 2014 operating shy of LOS E conditions. Adding an additional two-way left turn lane on Henderson Avenue for left-turning vehicles will improve the capacity of this roadway segment. The LOS for the year 2016 is D and the roadway segment still has additional capacity. For the year 2035 the LOS changes to E from LOS D. However, after the site improvements such as the TWLTL is added, the V/C ratio is at the cusp of changing to LOS D. Belmont Avenue is projected to operate under capacity thresholds for both year 2016 and 2035 conditions.

## V. CONCLUSIONS AND RECOMMENDATIONS

Analysis results indicates that the signalized intersections of Henderson Avenue/Belmont Avenue and Henderson Avenue/McMillan Avenue will continue to operate at overall LOS C or better throughout all the scenarios evaluated for the years 2016 and 2035.

The study area unsignalized intersection approaches are expected to operate within acceptable conditions for 2016, except for the southbound approach at Henderson Avenue and Drive E, which is expected to operate at LOS E conditions during the PM peak. All proposed driveways are expected to operate at or above LOS D conditions for both AM and PM peak periods for opening year 2016.

Analysis results for year 2035 during the AM peak hour shows all unsignalized intersections and driveways operating at LOS D or above, except for the northbound approach of Henderson Avenue and Capitol Avenue, which is expected to operate at LOS F. Our recommendation to mitigate long delays on Capitol Avenue is to restripe it with a northbound left-turn storage lane. Although delay times are not ideal, the analysis shows a 95<sup>th</sup> percentile queue length of fewer than 4 vehicles for northbound Capitol Avenue.

Year 2035 PM peak hour results indicate that existing study area unsignalized intersections will continue to see increased delays and limited gaps as volumes increase on Henderson Avenue. Although this proposed development contributes to some delay throughout the study area in year 2035, background growth not associated with the development is also a contributing factor to study area unsignalized intersections operating over capacity. Although delay times have increased, the analysis shows a 95<sup>th</sup> percentile queue length of only 1-3 vehicles for all unsignalized intersection approaches, except for Capitol Avenue and Drive E. The 95<sup>th</sup> percentile queue lengths for Capitol Avenue and Drive E approaches are fewer than 5 cars. Even though three of the unsignalized approaches are operating at LOS F, delays seen in the models are typical of urban environments. If long wait times persist at Henderson Avenue and Capitol Avenue, drivers will divert to the signal at Belmont Avenue, which has ample capacity for year 2035. Furthermore, the proposed development includes a Traffic Management Plan (TMP), which will be updated biannually to reflect and address congestion issues on site driveways and adjacent streets.

The following roadway improvements are recommended to improve access throughout the study area:

### General

1. Henderson Avenue will be improved to provide for a Two-Way Left Turn Lane (TWLTL) starting from just west of Glencoe Street and ending at McMillan Avenue. The TWLTL will provide for easier access to the driveways in and out of the site, while minimizing delays resulting from drivers turning left from Henderson Avenue. By contrasting the pavement color of the TWLTL and decreasing the width of the eastbound and westbound travel lanes, the resulting three lane configuration will encourage slower driving.

### Drive A and Henderson Avenue

2. Although the available storage for this turn lane is minimal due to proximity of Glencoe Street, the 95<sup>th</sup> percentile queue is very minimal (1-2 cars).
3. Provide for a one-lane exiting approach (shared left/right lane).

Drive B and Henderson Avenue:

4. No intersection improvements are recommended at this driveway.
5. Drive will operate as inbound only.

Drive C and Henderson Avenue

6. No Intersections improvements are recommended at this driveway.
7. Drive will operate as outbound only. Provide for a one-lane exiting approach (shared left/right lane).

Drive D and Henderson Avenue

8. Provide for a two-lane exit consisting of a right-turn only lane and a shared through/left-turn lane.

Drive E and Henderson Avenue

9. Provide for a one-lane exiting approach (shared left/right lane)

Capitol Avenue and Henderson Avenue

10. Re-stripe northbound Capitol Avenue to include a left-turn storage bay.

## VI. DISCUSSION OF THE CONTEXT FOR UNDERSTANDING THE TIA

Chapters I through V represent the typical elements that are submitted to the City of Dallas for a TIA in conjunction with a zoning application. However, Zoning Case Z145-300 is unique in several ways. This supplemental analysis for Z145-300 is provided to document the unique qualities of this new and sustainable project. The project is planned and designed to provide a Complete Streets cross-section to encourage walkability along the Henderson Avenue corridor. The project proposes to accommodate all of the code required parking substantially below grade with access provided at three driveways serving the north tract and two driveways serving the south tract on Henderson Avenue. In addition to parking for vehicles, parking for at least 30 bikes will be provided on site to encourage biking to the development. The existing zoning on the tracts in Z145-300 is based on areas and uses provided by GFF, which allows for 36,795 SF of restaurant use (with bars) and 106 multifamily units. If all the tracts were built out to their existing zoning, 36,795 SF (this number does not include any patio dining area, which in this case would be approximately 10,000 SF) of restaurant use and each dwelling unit had 4 bedrooms (1 person per bedroom), the ITE trip generation produced by the existing zoning development would be 6,104 one-way vehicle trips per day as shown in **Table 7**. The proposed development presented in Z145-300 generates 6,561 one-way trips per day according to the traditional ITE trip generation rates.

**Table 7 – Trip Generation Based on Existing Zoning**

Land Uses	Amount	Units	ITE Code	Daily	AM Peak Hour One-Way Trips			PM Peak Hour One-Way Trips		
				One-Way	IN	OUT	TOTAL	IN	OUT	TOTAL
				Trips						
Apartments*	424	Persons	220	1,403	57	62	119	100	70	170
High-Turnover (Sit-Down) Restaurant	36,975	SF	932	4,701	220	180	400	218	146	364
<b>Total Net New External Trips:</b>				<b>6,104</b>	<b>277</b>	<b>242</b>	<b>519</b>	<b>318</b>	<b>216</b>	<b>534</b>

\* There was no directional distribution available for trip generations based on Persons for Peak Hour of Adjacent Street Traffic in the ITE Manual. Therefore, the directional distribution of the Peak Hour of the Generator was used for trip generation based on Persons.

The proposed development is inspired by the Complete Streets design concept for Henderson Avenue. Future occupants and patrons of the proposed development will walk more, bike more and use other modes of transportation, thus generating fewer trips than indicated by historical ITE rates. The main goal Complete Streets is to encourage multimodal transportation and achieve a reduction in vehicular trips by promoting other modes of travel through the design of the open space, streets and pedestrian realm. Traffic data for these types of developments is currently being collected around the country but has not yet been incorporated into the ITE Trip Generation Manual. ITE tends to overestimate the trip generation in a more walkable environment, since the data studied in the ITE Trip Generation Manual is primarily collected at isolated suburban sites with few if any transit services or pedestrian amenities.

Many of the existing land uses along Henderson Avenue are similar to the uses proposed in the Z145-300 development. In order to objectively assess the actual trip generation rates for these existing sites, we observed and counted in real time the inbound and outbound vehicular traffic to and from these sites. Under the heading **Henderson Corridor Trip Generation Comparisons** in the **Appendix**, there are several tables that show the comparison between ITE rates for inbound and outbound traffic and the in-field counted traffic for inbound and outbound trips. The difference between the ITE rates and the in-field counted

traffic for the land uses was then calculated and converted into a *Combined Observation Difference from ITE Standard*. These factors were then applied to the traditional ITE rates in **Table 1**, the results of which are shown in **Table 8** below. The adjustment factors were only applied for retail and restaurant land uses, since no existing office uses were observed under the study. The inbound and outbound trips of these existing land uses tended to be less on average than the ITE rates.

**Table 8 – Trip Generation Based on Similar Land Use Observations**

Land Uses	Amount	Units	ITE Code	Daily	AM Peak Hour One-Way Trips			PM Peak Hour One-Way Trips		
				One-Way	IN	OUT	TOTAL	IN	OUT	TOTAL
				Trips						
Office	88,000	SF	710	1,192	152	21	173	30	147	177
Retail - Shopping Center	90,000	SF	820	1,691	16	11	28	144	150	294
High-Turnover (Sit-Down) Restaurant	12,000	SF	932	671	22	20	42	64	40	104
<b>Total Net New External Trips:</b>				<b>3,554</b>	<b>190</b>	<b>52</b>	<b>242</b>	<b>238</b>	<b>337</b>	<b>575</b>

According to the trip generation based on the observed rates and the percentage adjustment factors applied to ITE rates, the proposed development will generate 3,554 daily one-way trips. This is 2,550 fewer overall daily one-way trips than are generated based on the existing zoning daily one-way trips according to standard ITE rates. The total AM peak hour one-way trips generated by the proposed development were less than half of the total AM peak hour one-way trips based on existing zoning according to standard ITE rates. For the proposed development the total AM peak hour one-way trips were 242, while for the existing zoning the total AM peak hour one-way trips were 519. Based on existing zoning, an additional 277 one-way trips would occur during the AM peak hour. The PM percentage adjustment factors based on observed trips were smaller. Whereas the proposed development produces 575 one-way trips during the PM peak hour, the total PM peak hour one-way trips generated based on existing zoning is 534. To find the intersection operational conditions for comparison of the two scenarios, the trip generations from **Table 7** for the existing zoning and **Table 8** for the proposed development (with the observed trip generation adjustments) were applied to the traffic models described in sections I through V. **Table 9** shows the resulting conditions and intersection operations for AM peak hour for the existing zoning, the proposed development with ITE rates and the proposed development with the adjusted ITE rates based on observations. **Table 10** shows the same comparison for resulting conditions and intersection operations for the PM peak hour.

\* Stop-Controlled Approach

For the AM peak hour, the signalized intersections operate at acceptable LOS for all three of the scenarios in years 2016 and 2035. The unsignalized intersection approaches have similar LOS for the year 2016 for all three of the scenarios and operate at acceptable conditions. For the year 2035, the northbound approach of Capitol Avenue operates at LOS F for the existing zoning scenario and the ITE rates scenario, while the same approach operates at LOS E in the “observed” scenario. The northbound approach of Fuqua Street operates at LOS E for the existing zoning scenario in comparison to both proposed zoning scenarios (ITE Standard/“observed”), where the approach operates at LOS D. All other unsignalized approaches operate at LOS D or better for all three scenarios.

For the PM peak hour, the signalized intersections operate at acceptable LOS for all three scenarios in years 2016 and 2035. The unsignalized intersections in the PM peak hour for the year 2016 operate at acceptable conditions for all three scenarios, with the exception of Drive E. Drive E operates at LOS E for the proposed zoning with ITE rates scenario. The LOS begins to degrade for all three scenarios in 2035. The northbound approach of Capitol Avenue operates at LOS F for all three scenarios. The southbound approach of Glencoe Street and the northbound approach of Monarch Street operates at LOS E for all three scenarios. The northbound approach of Fuqua Street operates at LOS F for the proposed zoning with ITE rates scenario, while the same approach operates at LOS E for the other two scenarios (Existing zoning/“observed”). Drive E’s southbound approach operates at LOS F for the proposed zoning with ITE rates scenario, while the same approach operates at LOS E for the other two scenarios (Existing zoning/“observed”). The remaining unsignalized intersection approaches operate at LOS D or better.

In summary, the proposed development will not impact the street network any more than a fully developed site based on existing zoning. The anticipated LOS and delays for all three different scenarios are similar for both the signalized intersections and most of the unsignalized intersection approaches for the AM and PM peak hour. The proposed development can be incorporated within the existing network without adversely affecting the LOS and operations at existing unsignalized intersections. The proposed development will also provide a safer environment for pedestrians, encourage multimodal travel and enhance the corridor with site-related improvements.

## VII. DISCUSSION OF ALTERNATIVE DEVELOPMENT PLAN

The purpose of this chapter is to discuss the alternative development plan proposed by the City Design Studio, which includes 11 on-street parking spaces parallel and adjacent to the northern tract of the development site. In order to accommodate the proposed 11 parallel parking spaces, it becomes necessary to eliminate the TWLTL. The alternative development plan provides minimal storage for left-turns at drives A, C and E, although this storage is inadequate for the anticipated queuing. A conceptual plan for this is shown in the **Appendix**.

*The proposed development provides a two-level garage under the northern tract with 754 spaces, 23 surface spaces and 43 surface spaces on the southern tract of the development.*

The impact of the proposed parallel parking spaces on the corridor was studied using the microsimulation software VISSIM. VISSIM allows for modeling of the parallel parking spaces, measuring the effects of drivers entering and exiting the parallel parking spaces and how those delays would propagate through the corridor. VISSIM has numerous parameters/variables that can be adjusted such as driver behavior, vehicle characteristics, speed distributions, acceleration behavior, etc., but most of these settings remained at their default values for this study.

VISSIM also collects data on various parameters such as delay at intersections, travel times, speeds, number of stops, emissions, etc. The data collection parameters that were used for this analysis were delays at the unsignalized intersections, delays at signalized intersections and travel time eastbound and westbound through the corridor. The trip generation and distribution used for the VISSIM models was the same as the ITE trip generation rates used in the TIA.

Once the network was coded, the model was simulated to gather data for delay at unsignalized intersections, delay at signalized intersections and travel time through the corridor. The raw output from these model runs was analyzed. The AM and PM peak hour results for both scenarios are shown in the tables below.

**Tables 11 and 12** show the AM and PM peak hour delays, LOS and vehicles processed through each approach for the signalized intersections.

Removal of the TWLTL did not affect the operations at the signalized intersections. In both scenarios (Proposed and Alternative Development Plan per City Design Studio) for AM and PM peak hour year 2035, both the signalized intersections of Henderson Avenue and Belmont Avenue, and Henderson Avenue and McMillan Avenue operated at or above acceptable conditions.

**Tables 13 through 16** show maximum queue lengths, volumes, delays and LOS for the unsignalized intersection approaches for the AM and PM Peak hour.

\*Stop Controlled Approach

For the AM peak hour most of the unsignalized intersection approaches operate at similar LOS and delays. The northbound left turns for the unsignalized intersection approaches of Capitol Avenue and Monarch Street operate with longer delays and a lower LOS for both scenarios. The northbound left-turns for the unsignalized intersection approach of Fuqua Street operates at LOS E for the alternative scenario, while the same left turn operates at LOS C for the proposed scenario. All other unsignalized approaches are operate at acceptable LOS.

During the PM peak hour, most of the unsignalized intersection approaches experience similar amounts of delay and operate at similar LOS. However, the intersections of Fuqua Street/Drive D and Henderson Avenue experience the most degradation when comparing the two scenarios. Although the alternative development plan provides for minimal, albeit inadequate left-turn lanes for most of the driveways, the Fuqua Street/Drive D intersection does not have a left-turn lane due to the space allocated for parallel parking on Henderson Avenue. As **Table 16** shows, the northbound approach is failing due to limited gaps in traffic; the southbound approach is operating poorly as well. Without the TWLTL, northbound and southbound vehicles on Fuqua Street and at Drive D are forced to queue as they wait for vehicles on Henderson Avenue to complete their left-turns and through movements.

The delay experienced by eastbound and westbound travelers is more clearly observed when comparing travel times. **Tables 17** and **18** show the travel time for vehicles traveling eastbound and westbound on Henderson Avenue through the corridor. Travel times for eastbound Henderson Avenue drivers were taken from just west of Belmont Avenue to just east of Monarch Street. Travel times for westbound Henderson Avenue drivers were taken from just east of Monarch Street to just west of Belmont Avenue. The distance for both travel times was roughly the same.

**Table 17 – AM Travel Time through the Corridor**

AM Travel Time Difference				
Direction	Distance (Feet)	Travel Time (Seconds)		Time Difference (seconds)
		Proposed	Alternative DP Per City Design Studio	
Henderson (EB)	2,950	85	87	+ 2
Henderson (WB)	2,960	99	123	+ 24

**Table 18 – PM Travel Time through the Corridor**

PM Travel Time Difference				
Direction	Distance (Feet)	Travel Time (Seconds)		Time Difference (seconds)
		Proposed	Alternative DP Per City Design Studio	
Henderson (EB)	2,950	94	96	+ 2
Henderson (WB)	2,960	104	146	+ 42

As shown in **Tables 17** and **18** above, the bulk of the delay in travel time occurs on westbound Henderson Avenue where parallel parking is proposed. Drivers trying to parallel park in urban environments disrupt the flow of traffic as the cars behind them cannot pass by, especially where there are no adjacent lanes in the same direction. There will be additional delay caused by parallel parking in conjunction with the removal of the TWLTL from that specific area. All these factors combined with the competing traffic from the various approaches trying to make left-turns with no protected turn lane lead to long travel times for the westbound direction. In the context of the alternative parallel parking scenario, westbound Henderson drivers experience 42 seconds of additional delay when traveling the corridor (2,960 ft).

The ultimate goal of this project is to create a unique and sustainable environment for its users, where multiple modes of travel are encouraged, while maintaining mobility through the corridor and acceptable LOS at its various intersections and driveways. The proposed development achieves this balance by providing a TWLTL that encourages a steady flow of traffic while minimizing delay due to left-turns. Travel speeds within a complete street corridor of this type should be between 20 – 25 mph in order to maintain traffic flow, while providing safety for pedestrians and bicyclists traveling at lower speeds. The benefit of adding 11 parallel parking spaces to the 820 parking spaces already provided is negligible when compared to the adverse impacts (i.e. delays, disruptions and prolonged travel times) caused by the addition of parallel parking spaces and removal of the TWLTL.

## Roadway Preparation

The Roadway Preparation program imports a TransCAD roadway file which contains approach links, and prepares the roadway for skimming by creating fields that will be used downstream in the model run and initializing values of some of these fields.

### Inputs

APPRDWY.DB – A TransCAD geographic file that contains the approach links.

ACTRDWY.DB – A TransCAD geographic file from another model run from which initial times will be borrowed.

FreeSpeedParameters.DB – a Free Speed Parameters file which relates functional class, area type, control A and control B with a value for delay in the AB and BA direction.

CPIFactors.DB – A CPI Factors file where each row lists a year and the Consumer Price Index for that year.

TSZ.DB – The zone layer file which will be used to identify the TSZ which each link belongs to; this process is called tagging in TransCAD.

PATRIPS.DB – A file produced from the Trip Generation module which associates the TSZ with an area type. This PATRIPS.DB used will correspond to the Zonal Activity folder chosen.

Toll Value Year – A year for which toll values are adjusted to 1999 based on CPI Factors. It should represent the year for which toll values have been coded.

### Steps

The Roadway Preparation Program proceeds through the following steps.

1. Set up the data arrays.

- a. AMFactor, PMFactor, OPFactor – These factors are used in the conversion of capacity from hourly to time period. Factors are defined by functional class 1-8 and listed in Exhibit 3-11. These factors were changed in July 2005 and documented in “Capacity factors\_RE 1999 New Run vs. Run 243 Comparison.”

Exhibit 3-11: Capacity Conversion of Factors from Hourly to Time Period

TIME PERIOD	FUNCTIONAL CLASS						
	Freeway	Principal Arterial	Minor Arterial	Collector	Freeway Ramp	Frontage Road	HOV
AM	2.3	2.1	2.1	2.1	2.3	2.1	2.3
PM	3.2	2.9	2.9	2.9	3.2	2.9	3.2
OP	10.0	9.2	9.2	9.2	10.0	9.2	10.0

- b. Roadway Approach Link Speeds – The Roadway Approach Link speeds are off-peak and peak speeds for each area type; the speeds are listed in Exhibit 3-12.

Exhibit 3-12: Centroid Speed by Area Type and Time Period

Area Type	Off-Peak Speed	Peak Speed
<b>Central Business District (CBD)</b>	15	11
<b>Outer Business District</b>	23	13
<b>Urban Residential</b>	27	17
<b>Suburban Residential</b>	33	21
<b>Rural</b>	39	23

- c. Hourly Capacity Per Lane (Divided or One-Way Roads) – The hourly capacity per lane for divided roads is given by area type and functional class in Exhibit 3-13.<sup>1</sup>

Exhibit 3-13: Hourly Capacity Per Lane – Divided or One-Way Roads<sup>1</sup>

Area Type	Functional Class						
	Freeway	Principal Arterial	Minor Arterial	Collector	Freeway Ramp	Frontage Road	HOV
CBD	2050	725	725	475	1250	725	2050
Outer Business District	2125	775	775	500	1375	775	2125
Urban Residential	2150	850	825	525	1425	850	2150
Suburban Residential	2225	925	900	575	1600	900	2225
Rural	2300	1025	975	600	1725	975	2300

- d. Hourly Capacity Per Lane (Undivided Roads) – The hourly capacity per lane for undivided roads is given by area type and functional class in Exhibit 3-14.

---

<sup>1</sup> The values in the body of the table are expressed in passenger cars per hour per lane (pcphpl). They correspond to volumes at level-of-service (LOS) E. The calculation of LOS requires the conversion of the model volume to passenger car equivalents (PCE). These adjustments are treated in an aggregate manner in the travel model based on the actual field data on the freeway network as follows:

LOS	AM Volume Adjustment Factor	PM Volume Adjustment Factor	Upper Threshold for Volume to Capacity Ratio
A, B, C	1.06	1.00	0.65
D or E	1.18	1.25	1.00

The model volumes are taken from the AMHRVOL\_AB / AMHRVOL\_BA or PMHRVOL\_AB / PMHRVOL\_BA fields. The corresponding capacity values are taken from the AMHRCAP\_AB / AMHRCAP\_BA or PMHRCAP\_AB / PMHRCAP\_BA fields respectively.

Exhibit 3-14: Hourly Capacity Per Lane – Undivided Roads<sup>1</sup>

Area Type	Functional Class						
	Freeway	Principal Arterial	Minor Arterial	Collector	Freeway Ramp	Frontage Road	HOV
CBD	N/A	650	650	425	1250	650	N/A
Outer Business District	N/A	725	725	450	1375	725	N/A
Urban Residential	N/A	775	750	475	1425	750	N/A
Suburban Residential	N/A	875	825	525	1600	825	N/A
Rural	N/A	925	875	550	1725	875	N/A

- e. Peak and off-peak ratios are used for estimating the initial loaded travel times. The peak and off-peak ratios are calculated for each functional class and area type pair.

$$pkRatio_{fa} = \begin{cases} \frac{\sum \lfloor \text{Old PKFRTIME} \rfloor_{fa}}{\sum \lfloor \text{Old PKTIME} \rfloor_{fa}}, & \text{if } \sum \lfloor \text{Old PKTIME} \rfloor_{fa} > \sum \lfloor \text{Old PKFRTIME} \rfloor_{fa} \text{ and } \sum \lfloor \text{Old PKTIME} \rfloor_{fa} > 0, \\ 0.999 & \text{Otherwise} \end{cases} \quad (3-1)$$

$$opRatio_{fa} = \begin{cases} \frac{\sum \lfloor \text{Old OPFRTIME} \rfloor_{fa}}{\sum \lfloor \text{Old OPTIME} \rfloor_{fa}}, & \text{if } \sum \lfloor \text{Old OPTIME} \rfloor_{fa} > \sum \lfloor \text{Old OPFRTIME} \rfloor_{fa} \text{ and } \sum \lfloor \text{Old OPTIME} \rfloor_{fa} > 0, \\ 0.999 & \text{Otherwise} \end{cases} \quad (3-2)$$

where

$f$  = functional class between 1 and 8.

$a$  = area type.

$\sum \lfloor \text{Old PKFRTIME} \rfloor_{fa}$  = Sum of peak free travel time from the “Copy From” roadway for functional class  $f$  and area type  $a$ . The peak free travel times are taken from the PKFRTIME\_AB and PKFRTIME\_BA fields from the ACTRDWY.DBD.

$\sum \lfloor \text{Old PKTIME} \rfloor_{fa}$  = Sum of peak loaded travel time from the “Copy From” roadway for functional class  $f$  and area type  $a$ . The peak loaded travel times are taken from the PKTIME\_AB and PKTIME\_BA fields from the ACTRDWY.DBD.

**Synchro<sup>TM</sup> Output - 2014 Existing Traffic**
